1.1 基礎方程式

軸対称・定常磁気流体方程式 (Oda et al. 2009)

$$\frac{\partial}{r\partial r}\left(r\rho v_r\right) + \frac{\partial}{\partial z} = 0,\tag{1}$$

$$\rho v_r \frac{\partial v_r}{\partial r} + \rho v_z \frac{\partial v_r}{\partial z} - \frac{\rho v_{\varphi}^2}{r} = -\rho \frac{\psi}{\partial r} - \frac{\partial p_{\text{tot}}}{\partial r} - \frac{\langle B_{\varphi}^2 \rangle}{4\pi r^2},\tag{2}$$

$$\rho v_r \frac{\partial v_{\varphi}}{\partial r} + \rho v_z \frac{\partial v_{\varphi}}{\partial z} + \frac{\rho v_r v_{\varphi}}{r} = \frac{\partial}{r^2 \partial r} \left(r^2 \frac{\langle B_r B_{\varphi} \rangle}{4\pi} \right) + \frac{\partial}{\partial z} \left(\frac{\langle B_{\varphi} B_z \rangle}{4\pi} \right), \tag{3}$$

$$0 = -\frac{\partial \psi}{\partial z} - \frac{1}{\rho} \frac{\partial p_{\text{tot}}}{\partial z},\tag{4}$$

$$\frac{\partial}{\partial r} \left[\left(\rho \epsilon + p_{\text{gas}} + p_{\text{rad}} \right) v_r \right] + \frac{v_r}{r} \left(\rho \epsilon + p_{\text{g}} + p_r \right) + \frac{\partial}{\partial z} \left[\left(\rho \epsilon + p_{\text{gas}} + p_{\text{rad}} v_z \right) \right] - v_r \frac{\partial}{\partial r} \left(p_{\text{gas}} + p_{\text{rad}} \right) - v_z \frac{\partial}{\partial z} \left(p_{\text{gas}} + p_{\text{rad}} \right) = q^{+1} \left(p_{\text{gas}} + p_{\text{rad}} \right) - v_z \frac{\partial}{\partial z} \left(p_{\text{gas}} + p_{\text{rad}} \right) - v_z \frac{\partial}{\partial z} \left(p_{\text{gas}} + p_{\text{rad}} \right) - v_z \frac{\partial}{\partial z} \left(p_{\text{gas}} + p_{\text{rad}} \right) - v_z \frac{\partial}{\partial z} \left(p_{\text{gas}} + p_{\text{rad}} \right) - v_z \frac{\partial}{\partial z} \left(p_{\text{gas}} + p_{\text{rad}} \right) - v_z \frac{\partial}{\partial z} \left(p_{\text{gas}} + p_{\text{rad}} \right) - v_z \frac{\partial}{\partial z} \left(p_{\text{gas}} + p_{\text{rad}} \right) - v_z \frac{\partial}{\partial z} \left(p_{\text{gas}} + p_{\text{rad}} \right) - v_z \frac{\partial}{\partial z} \left(p_{\text{gas}} + p_{\text{rad}} \right) - v_z \frac{\partial}{\partial z} \left(p_{\text{gas}} + p_{\text{rad}} \right) - v_z \frac{\partial}{\partial z} \left(p_{\text{gas}} + p_{\text{rad}} \right) - v_z \frac{\partial}{\partial z} \left(p_{\text{gas}} + p_{\text{rad}} \right) - v_z \frac{\partial}{\partial z} \left(p_{\text{gas}} + p_{\text{rad}} \right) - v_z \frac{\partial}{\partial z} \left(p_{\text{gas}} + p_{\text{rad}} \right) - v_z \frac{\partial}{\partial z} \left(p_{\text{gas}} + p_{\text{rad}} \right) - v_z \frac{\partial}{\partial z} \left(p_{\text{gas}} + p_{\text{rad}} \right) - v_z \frac{\partial}{\partial z} \left(p_{\text{gas}} + p_{\text{rad}} \right) - v_z \frac{\partial}{\partial z} \left(p_{\text{gas}} + p_{\text{rad}} \right) - v_z \frac{\partial}{\partial z} \left(p_{\text{gas}} + p_{\text{rad}} \right) - v_z \frac{\partial}{\partial z} \left(p_{\text{gas}} + p_{\text{rad}} \right) - v_z \frac{\partial}{\partial z} \left(p_{\text{gas}} + p_{\text{rad}} \right) - v_z \frac{\partial}{\partial z} \left(p_{\text{gas}} + p_{\text{rad}} \right) - v_z \frac{\partial}{\partial z} \left(p_{\text{gas}} + p_{\text{rad}} \right) - v_z \frac{\partial}{\partial z} \left(p_{\text{gas}} + p_{\text{rad}} \right) - v_z \frac{\partial}{\partial z} \left(p_{\text{gas}} + p_{\text{rad}} \right) - v_z \frac{\partial}{\partial z} \left(p_{\text{gas}} + p_{\text{rad}} \right) - v_z \frac{\partial}{\partial z} \left(p_{\text{gas}} + p_{\text{rad}} \right) - v_z \frac{\partial}{\partial z} \left(p_{\text{gas}} + p_{\text{rad}} \right) - v_z \frac{\partial}{\partial z} \left(p_{\text{gas}} + p_{\text{rad}} \right) - v_z \frac{\partial}{\partial z} \left(p_{\text{gas}} + p_{\text{rad}} \right) - v_z \frac{\partial}{\partial z} \left(p_{\text{gas}} + p_{\text{rad}} \right) - v_z \frac{\partial}{\partial z} \left(p_{\text{gas}} + p_{\text{rad}} \right) - v_z \frac{\partial}{\partial z} \left(p_{\text{gas}} + p_{\text{rad}} \right) - v_z \frac{\partial}{\partial z} \left(p_{\text{gas}} + p_{\text{rad}} \right) - v_z \frac{\partial}{\partial z} \left(p_{\text{gas}} + p_{\text{rad}} \right) - v_z \frac{\partial}{\partial z} \left(p_{\text{gas}} + p_{\text{rad}} \right) - v_z \frac{\partial}{\partial z} \left(p_{\text{gas}} + p_{\text{rad}} \right) - v_z \frac{\partial}{\partial z} \left(p_{\text{gas}} + p_{\text{rad}} \right) - v_z \frac{\partial}{\partial$$

$$0 = -\frac{\partial}{\partial z} \left[v_z \langle B_z \rangle \right] - \frac{\partial}{\partial r} \left[v_r \langle B_\varphi \rangle \right] + \left[\nabla \times \langle \delta v \times \delta B \rangle \right]_{\varphi} - \left[\eta \nabla \times (\nabla \times \langle B \rangle) \right]. \tag{6}$$

ここで、 $\psi=-GM_{\rm BH}/r^3, \rho\epsilon=p_{\rm gas}/(\gamma-1)+3p_{\rm rad}, q^+, \text{ and } q^-$ はそれぞれ、重力ポテンシャル、加熱率、冷却率。

また、鉛直方向にはポリトロピック関係 $p_{ ext{tot}} = K
ho^{(1+1/N)}$ を仮定。ここで、

$$\rho(r,z) = \rho_0(r) \exp\left(1 - \frac{z^2}{H^2}\right)^N,\tag{7}$$

$$p_{\text{tot}}(r,z) = p_{\text{tot},0}(r) \exp\left(1 - \frac{z^2}{H^2}\right)^{N+1},$$
 (8)

$$T(r,z) = T_0(r) \exp\left(1 - \frac{z^2}{H^2}\right).$$
 (9)

添字の 0 は赤道面での値、また $H^2=\frac{2(N+1)}{\Omega_{\rm K0}^2}\frac{p_{\rm tot,0}}{\rho_0}$ は円盤の半厚み、 $\Omega_{\rm K0}=\sqrt{\frac{GM_{\rm BH}}{r^3}}$ は ケプラー角速度。以上を鉛直方向に積分すると面密度、鉛直積分した圧力は

$$\Sigma = \int_{-H}^{+H} \rho dz = 2\rho_0 I_{\rm N} H, \tag{10}$$

$$W_{\text{tot}} = \int_{-H}^{+H} p_{\text{tot}} dz = 2p_{\text{tot},0} I_{N+1} H.$$
 (11)

ここで、 $I_{\rm N}=(2^NN!)^2/(2N+1)!$ 。また、円盤半厚みは

$$H^{2} = \frac{2N+3}{\Omega_{K0}^{2}} \frac{W_{\text{tot}}}{\Sigma}.$$
 (12)

と書き換えられる。

1.2 鉛直積分した基礎方程式

$$\dot{M} = -2\pi r \Sigma v_r = const., \tag{13}$$

$$\dot{M}(l - l_{\rm in}) = -2\pi r^2 \int_{-H}^{+H} \frac{\langle B_r B_\varphi \rangle}{4\pi} dz, \tag{14}$$

$$\frac{\dot{M}}{2\pi r^2} \frac{W_{\rm rad} + W_{\rm gas}}{\Sigma} \xi = Q^+ - Q^-, \tag{15}$$

$$\dot{\Phi} = \int_{-H}^{+H} v_r \langle B_\varphi \rangle dz = \int_r^{r_{\text{out}}} \int_{-H}^{+H} \left[\{ \nabla \times \langle \delta v \times \delta B \rangle \}_\varphi - \{ \eta \nabla \times (\nabla \times \langle B \rangle) \} \right] dr dz + const.$$
(16)

磁場は

$$\Phi = B_{\varphi}H = \Phi_0(\Sigma/\Sigma_0)^{\zeta}. \tag{17}$$

で定義。

1.3 加熱・冷却率

粘性加熱率:

$$Q^{+} = \int_{-H}^{+H} \frac{\langle B_r B_{\varphi} \rangle}{4\pi} r \frac{d\Omega}{dr} dz = -\alpha W_{\text{tot}} r \frac{d\Omega}{dr}.$$
 (18)

移流冷却率:

$$Q_{\text{adv}}^{-} = \frac{\dot{M}}{2\pi r^2} \frac{W_{\text{rad}} + W_{\text{gas}}}{\Sigma} \xi \tag{19}$$

光学的に薄い場合の輻射冷却率(制動放射):

$$Q_{\rm thin}^{-} = 6.2 \times 10^{20} \frac{I_{2N+1/2}}{2I_N^2} \frac{\Sigma^2}{H} T_0^{1/2}, \tag{20}$$

光学的に厚い場合の輻射冷却率:

$$Q_{\text{thick}}^{-} = \frac{16\sigma I_N T_0^4}{3\tau/2},\tag{21}$$

ここで、 $\tau=\tau_{\rm es}+\tau_{\rm abs},\, \tau_{\rm es}=0.5\kappa_{\rm es}\Sigma$ 。また、吸収に対する光学的厚みは

$$\tau_{\rm abs} = \frac{8I_{\rm N}^2}{3I_{\rm N+4}\tau} \frac{Q_{\rm thin}^+}{Q_{\rm thick}^-}.$$
 (22)

輻射冷却は、光学的に薄い場合と厚い場合に使える近似解 (e.g., Hubney 1990, Abramowicz et al. 1995)

$$Q^{-} = \frac{16\sigma I_N T_0^4}{3\tau/2 + \sqrt{3} + \tau_{\text{abs}}^{-1}},\tag{23}$$

を用いる。

コンプトン散乱による冷却率:

$$Q_{\text{Comp}}^{-} = Q^{-} \kappa_{\text{es}} \Sigma \frac{4k_{\text{b}}}{m_{\text{e}} c^{2}} \left(\frac{I_{\text{N}+1}}{I_{\text{N}}} T_{\text{e}0} - T_{\text{r}} \right).$$
 (24)

ここで、 $T_{\rm e0}=\min{(T_0,10^9~{
m K})}$ は電子温度、 $T_{\rm r}=(Q^-/(a_{
m r}c))^{1/4}$ は輻射温度。

1.4 解くべき方程式

$$(25)$$

$$(26)$$

$$\text{ZZC, } r = \tilde{r}r_{\rm s}, \ \Omega = \frac{c}{r_{\rm s}}\sqrt{\frac{1}{2\tilde{r}^3}} = \frac{c}{r_{\rm s}}\tilde{\Omega}, \ H = \frac{1}{\tilde{\Omega}}\sqrt{2N+3}(\frac{W_{\rm tot}}{\Sigma})^{1/2}\frac{r_{\rm s}}{c} = \tilde{H}r_{\rm s}, \ \dot{M} = \dot{m}\dot{M}_{\rm Edd}.$$
